

# Sposta Raster (World File) Plugin - Documentation

This plugin allows you to reposition non-georeferenced raster images (PNG/JPG/TIFF with world files) by clicking directly on the QGIS map canvas.

It automatically updates the world file (.pgw, .jgw, .tfw) and reloads the raster.

1. Load your raster (PNG/JPG/TIFF without internal georeferencing) in QGIS.
2. Enable the plugin (Plugins > Manage and Install Plugins > Sposta Raster World File).
3. Click the plugin toolbar button to activate move mode.
4. Click on the map at the desired location:
  - In Upper Left Corner mode, the clicked point becomes the new top-left corner.
  - In Center mode, the clicked point becomes the new center of the image.
5. The raster will be automatically repositioned and reloaded.
6. Click the toolbar button again to toggle between modes (Upper Left Corner ↔ Center).
7. Use the 'Help (English)' menu option for quick instructions.
